

*Reduce your TCO while maximizing your performance!*

## Upgrade today!

Directory Server Enterprise Edition 7.0 allows you to grow faster and easier. The significant improvement in performance allows you to accelerate your applications while reducing your total cost of ownership. You can reduce cost by improving serviceability with faster import times, new easy upgrade in place, and with the only solution in the market that gives you a directory server, virtual directory, proxy server, web console and synchronization with Active Directory available all in one license.

If you are currently using DSEE 5.x you should keep the EOL dates in mind:

DSEE 5.1: 3/17/2011 EOL, limited support since 3/31/2007

DSEE 5.2 (All releases): 6/20/2013 EOL, limited support since 12/31/2009

Whether you are just upgrading to keep the support status up and running or to utilize the amazingly improved performance, we can help get you on the right track and keep you there.

## Directory Services Assessment

The Directory Service Assessment is designed to quickly evaluate your strategy and environment and makes sure you are taking the most effective approach to using technology to meet your IT requirements. Through a combination of workshops, interviews, systems analysis, and review of your environment, we will make specific recommendations on how to maximize your effective use of this technology. We're your partner for all things LDAP!

### Included in the assessment are the following components:

Directory Data Review: Schema, Directory Information Tree (DIT), Access Control Lists (ACL's), Indexing and Replication Topology Review of current LDAP design, including security analysis.

Directory Infrastructure Review: System, Storage, Network and Resource Utilization Review of current LDAP infrastructure.

Directory Client Review: Application analysis with respect to how they access LDAP data.

There may be recommendations to simplify the environment and reduce the number of individual configurations to a minimum by running application stacks within Virtual Machines (VM's), such as Oracle VM Server for SPARC and/or Oracle Solaris Containers.

Business Justification: We will also provide a high-level business justification for moving to a DSEE 7.0, running in a virtualized environment, including a Return on Investment (ROI) for justification of the project.

During this one week assessment process, our consultants will deliver a report with specific recommendations, business justification with ROI (if necessary), and a summary of the systems analysis that was collected.

### Service Information

**Fixed Price Service consists of a one-week assessment and may include an Architect, Systems Engineer and Project Manager. Service includes workshops, interviews and planning exercises.**

### Deliverables

- Business Justification
- Recommendations Presentation
- Summary of Systems Analysis

### Customer Experience

*"DiscoverIT was able to quickly come in and give us concrete recommendations on how to proceed and meet our business and technical objectives."*
